

BUILT ON ARC TESTNET

● MVP LIVE

ARCBUILDERPROOF

Verifiable proof-of-build for Arc builders.

A lightweight onchain registry where builders publish profiles, project proofs, source links, and reviewer-friendly evidence URLs — designed for grants, hackathons, and ecosystem accountability.

THE PROBLEM

TRUST IS STILL MOSTLY MANUAL

BUILDER EVIDENCE IS FRAGMENTED

Grant reviewers need proof, but builder progress lives across scattered links.

01

Offchain portfolios are easy to lose or fake

GitHub repos, demos, screenshots, docs, and social posts sit in separate systems with no shared source of truth.

02

Review cycles are slow

Teams spend time checking wallet ownership, source URLs, deployed apps, and grant evidence manually.

03

No persistent builder graph

04

MVPs lack credible provenance

Onchain proofs reduce review friction

ONE REGISTRY FOR PROOF-OF-BUILD

ArcBuilderProof turns builder progress into shareable, verifiable records.

Builders connect a wallet, save an onchain profile, create project proofs, and share static-safe URLs that reviewers can open without needing a dashboard login.

Builder Profiles

Name, bio, skills, and metadata anchored to the builder wallet.

Project Proofs

Title, description, proof URI, source URI, metadata URI, and timestamps.

Shareable URLs

Proof routes like `#/proof/1` work on Vercel or static hosting.

Reviewer Context

Clear links to app, repository, explorer, and evidence in one place.

PURPOSE-BUILT FOR ARC ECOSYSTEM GROWTH

ArcBuilderProof makes Arc a credible home for builders applying, shipping, and proving.

Arc Testnet deployment

The MVP already targets Arc Testnet, with public chain configuration embedded for static deployment and wallet onboarding.

Chain	Arc Testnet
-------	-------------

Chain ID	5042002
----------	---------

RPC	rpc.testnet.arc.network
-----	-------------------------

Explorer	testnet.arcscan.app
----------	---------------------

Fast proof publishing

Builders can anchor evidence during active grant cycles, hackathons, and milestones.

Composability

Profiles and proofs can become primitives for grant portals, bounty boards, launchpads, and reputation systems.

Ecosystem memory

Arc-native proof graph for builders
Every proof creates a durable trail of builders, projects, and shipped outcomes on Arc

HOW IT WORKS UNDER THE HOOD

Static frontend + Arc smart contract + public proof URLs.

UI

Vite React App

Static deploy on Vercel/GitHub
Pages with hash routing.

User Wallet

Injected wallet signs profile and
proof transactions.

SC

Arc Contract

Stores profile/proof strings,
ownership, and timestamps.

Reviewer Link

Public proof pages resolve by ID
for grant review.

Core contract functions

```
upsertBuilderProfile , createProjectProof ,  
updateProjectProof , getProjectProof ,  
getProofIdsByBuilder .
```

Security posture

No private data required. Contract stores public strings only; secrets
and sensitive personal data should never be published as metadata.

CURRENT DEPLOYMENT STATUS

Core product, contract, tests, and live deployment are already shipped.

1**Arc contract**

Deployed on Arc Testnet at
`0x5546...765F`.

5**Core methods**

Profile, proof creation, proof update, and lookup APIs.

100%**Static ready**

Vercel/GitHub Pages compatible app with public env config.

**Grant ready**

Live app, public repo, explorer address, and pitch materials.

Live app

THE PATH TO PRODUCTION

Expand from proof registry into ecosystem reputation infrastructure.

1

Phase 1 — Now

- Polish public proof pages for reviewers.
- Add richer demo data and proof templates.
- Improve wallet/network diagnostics.
- Publish grant deck and onboarding docs.

2

Phase 2 — Near Term

- Builder verification and project categories.
- Proof attestations from reviewers or partners.
- Searchable directory of Arc builders.
- Optional IPFS/Arweave metadata helpers.

3

Phase 3 — Ecosystem

- Grant portal integrations.
- Hackathon and bounty proof workflows.
- Reputation APIs for other Arc apps.
- Mainnet-ready deployment and analytics.

A COMPOUNDING BUILDER GRAPH

ArcBuilderProof can become the public memory layer for everything built on Arc.

01

For builders

One canonical profile and proof history that follows them across grants, hackathons, demos, and ecosystem work.

02

For reviewers

Less manual due diligence: project evidence, source code, app URLs, wallet ownership, and timestamps in one route.

03

For Arc

08 / Vision

A visible network of active builders and shipped outcomes that

04

For future apps

Make shipped work discoverable and verifiable

Composable proof data for grant dashboards, public goods funding,

ARCBUILDERPROOF

Grant-ready MVP for Arc builder accountability.

The current build demonstrates a pragmatic wedge: simple enough to ship now, extensible enough to become Arc's builder proof and reputation layer.

Built on Arc Testnet

Contract deployed, app live, repo public, deck exportable as PDF or editable HTML.
